<p>Preparation of flexible polyurethane foam(I) comprises reaction of polyisocyanate(s) (II) with polyol(s) (III) under following conditions: (1) (III) polyetherpolyol(s) having averaged functional number 2.45-4.5, averaged equiv. number 500-1,500, prim hydroxyl gp content above 25%, opt. modified with ethylenically unsatd. cpd(s), (2) uses 4.5 pts.wt or more of water per 100 pts wt of (III) as foaming agent, (3) NCO/OH is below 0.9. (II) is pref. alkylene oxide adduct(s) of one or more of polyol(s), saccharide(s), ethanolamine(s), etc, or polyetherpolyol(s) modified with acrylonitrile or styrene, (III) is pref toluenediisocyanate and/or polymeric MDI. (II) is reacted with (III) (NCO/OH = below 0.9, pref. 0.4-0.9) in presence of 4.5-15(pref. 8.0-13)wt% water, catalyst(e.g. triethylenediamine, methylimidazole, dibutyltin dilaurate etc), foaming stabilizer(e.g. siloxanes, polyalkylene oxide block copolymer etc), flame retardant, pigment, stabiliser etc.</p>	<p>conventionally. ADVANTAGE - (I) is prepd by reaction of (II) with specific (III) in presence of water without using former foaming agent, chlorofluorocarbon(s) and/or dichlorofluoromethane. (6pp Dwg.No.0/0)</p>
